DACRYSTIC SEIZURES: A CRY FOR HELP

A 69-year-old man with a history of myocardial infarction presented with crying-like spells. MRI demonstrated abnormal signal in the left mesiotemporal lobe, and he was diagnosed with stroke. Over the following 1 year, he developed progressive cognitive decline, slow gait, masked facies, hypophonic voice, and brief facial and upper extremity spasms (8 per hour) often followed by brief crying spells lacking emotion. Spell semiology was consistent with faciobrachial dystonic seizures and dacrystic seizures (video at Neurology.org/nn). Leucine-rich glioma-inactivated-1 (LGI1) autoantibodies, detected in serum, led to a diagnosis of anti-LGI1 encephalitis. This is the first report of dacrystic seizures accompanying anti-LGI1 encephalitis.

From the Department of Laboratory Medicine and Pathology (A.G., E.P.F., S.J.P.) and Department of Neurology (A.G., J.S., J.W.B., E.P.F., S.J.P.), Mayo Clinic, Rochester, MN.

Study funding: No targeted funding reported.

Disclosure: A. Gadoth and J. Singh report no disclosures. J.W. Britton received research support from Grifols and Mr. and Mrs. David Hawk charitable gift for epilepsy research. E.P. Flanagan reports no disclosures. S.J. Pittock and Mayo Clinic have a financial interest in patents that relate to functional AQP4/NMO-IgG assays and NMO-IgG as a cancer market. S.J. Pittock consulted for Alexion and MedImmune and received research support from Grifols, MedImmune, and Alexion, RO1 NS-65829-91. Go to Neurology.org/nn for full disclosure forms. The Article Processing Charge was funded by the authors.
